## When OEM is not good enough...

The most common 23,000 lb rated Original Equipment friction materials are Abex 685, Carlisle MB23 and Meritor® MA310/2. Though these are excellent linings, about 25% of commercial vehicles using 23,000 lb rated products need a higher temperature material. Typically these are vehicles that frequent the mountains, have a high duty cycle and/or are commonly hauling close to 40,000 lbs. The tell tale sign is when you see heat checks in the OEM linings. OTR has the solution.

The key to OTR Orange\* is a unique combination of raw materials which deliver two critical benefits over the above mentioned OEM linings:

- 1.) Thrives in 10% higher brake temperatures
- 2.) Delivers 20% higher flexural strength

\*Note – OTR also has a 25,000 lb rated product for more severe applications.

A couple of our fleets said it best:

*"With OTR Orange brake shoes, I never see a unit come back in with cracks in the linings. We have to replace all of our OEM brake shoes prematurely because of cracking problems. The life cycle of the OTR Orange is the best I've seen."*

*Billy Dorris  
Fleet Manager  
M&W Transportation  
Nashville, Tennessee*

*"We have been using OTR Orange brake shoes for over five years now. We do a lot of stop and go driving primarily on secondary, rural roads. This generates a lot of heat. OTR Orange has significantly extended our lining intervals."*

*Walter Smith  
Maintenance Director  
Columbia Farms, Inc  
Monetta, South Carolina*

So when the 23,000 lb OEM linings are not holding up, give Billy and Walter a listen. OTR Orange was their solution.

OTR Orange is the SMART choice because there's NO TIME FOR DOWNTIME.
